# **What's FRB?**

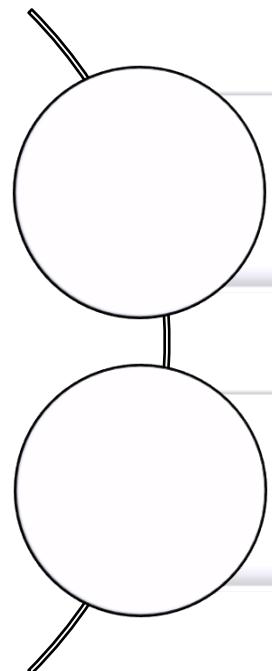

# POLAR COORDINATES CONVERT:

- Take the center of map as original point
- Calculate angle and radius length
- Interpolate the data with the coordinates . Finally we can Get the polar coordinates matrix, and could plot it with angle and radius axis.

**FRB ,Fast Radio Burst is a high energy physical phenomenon happened in our universe.**

**Happened suddenly**

**High Energy**

# How do we detect FRB?

# PROPERTY OF FRB

- Dispersion
- Scatter
- Scintillation

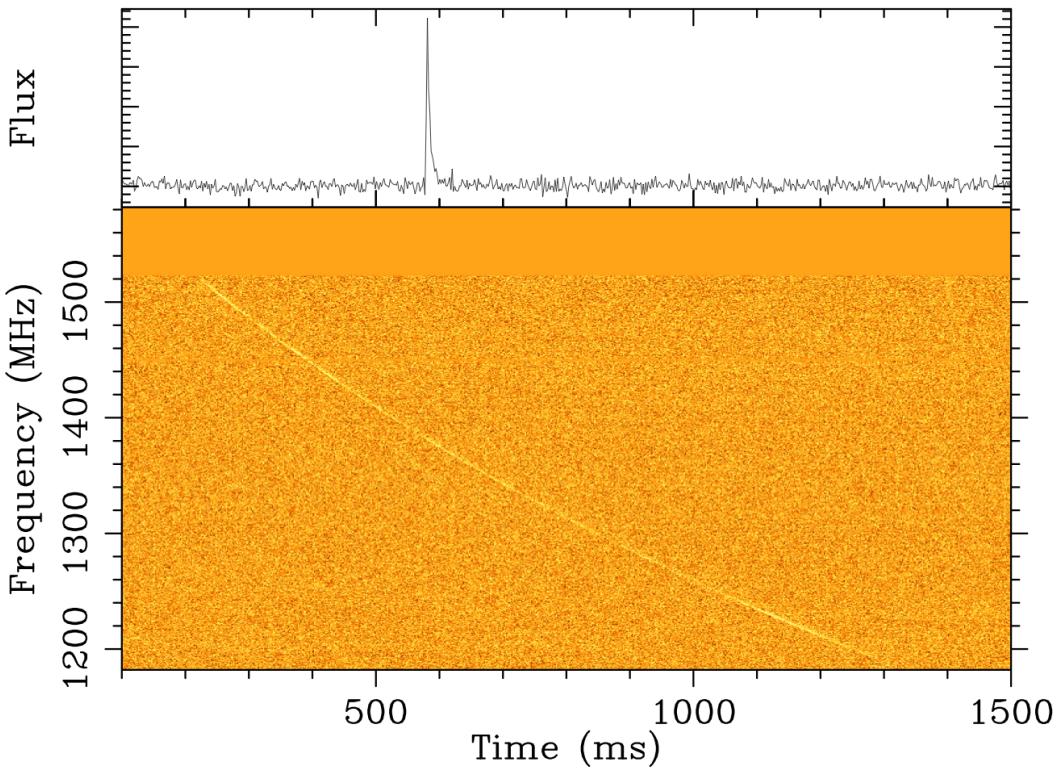

# DISPERSION

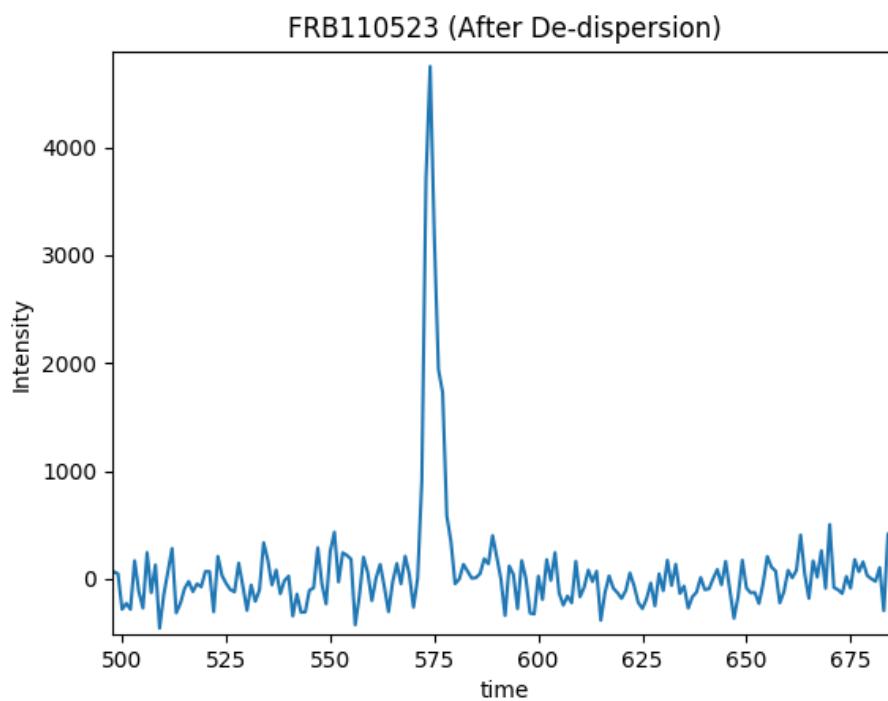

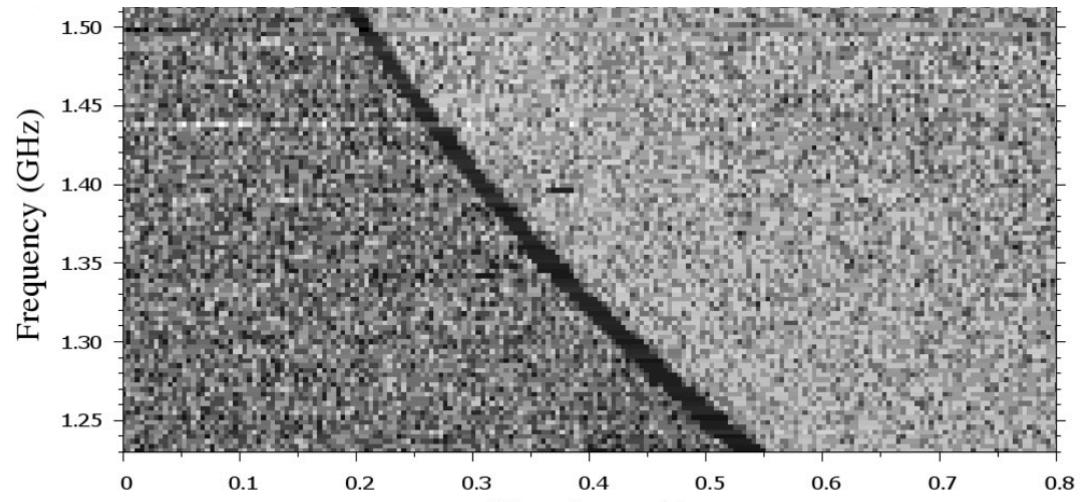

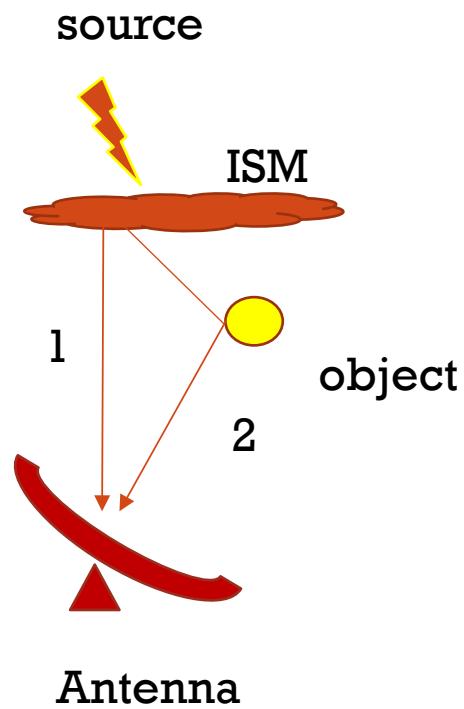

$$\Delta t = 4.15 \times 10^{-6} \text{ ms} \cdot \text{DM} \times (f_{\text{ref}}^{-2} - f_{\text{chan}}^{-2})$$

Dispersion Measure:

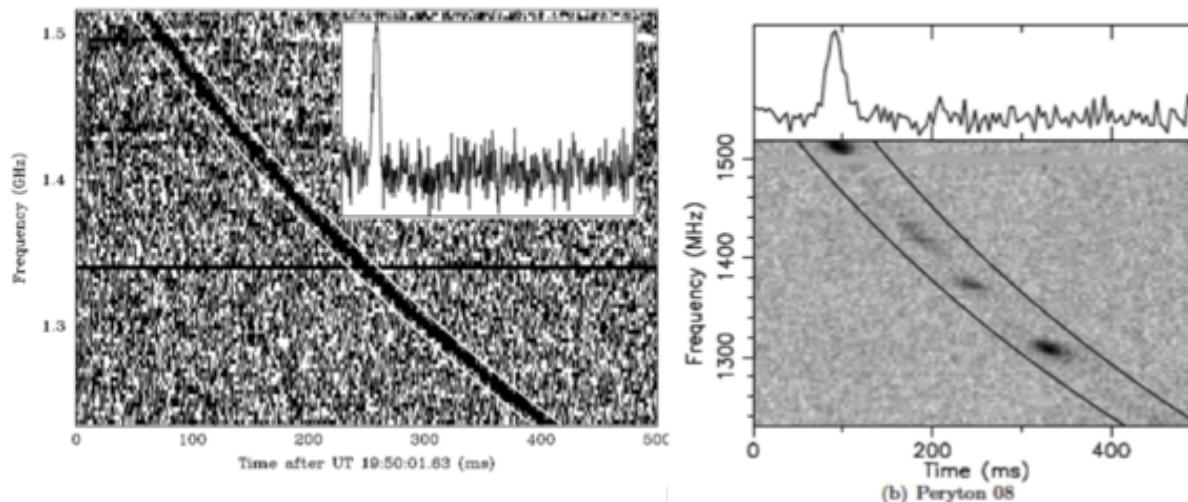

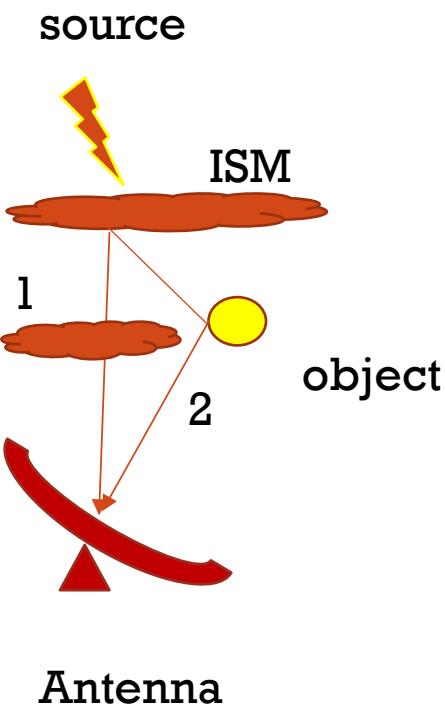

$$DM = \int_0^d n_e dl$$

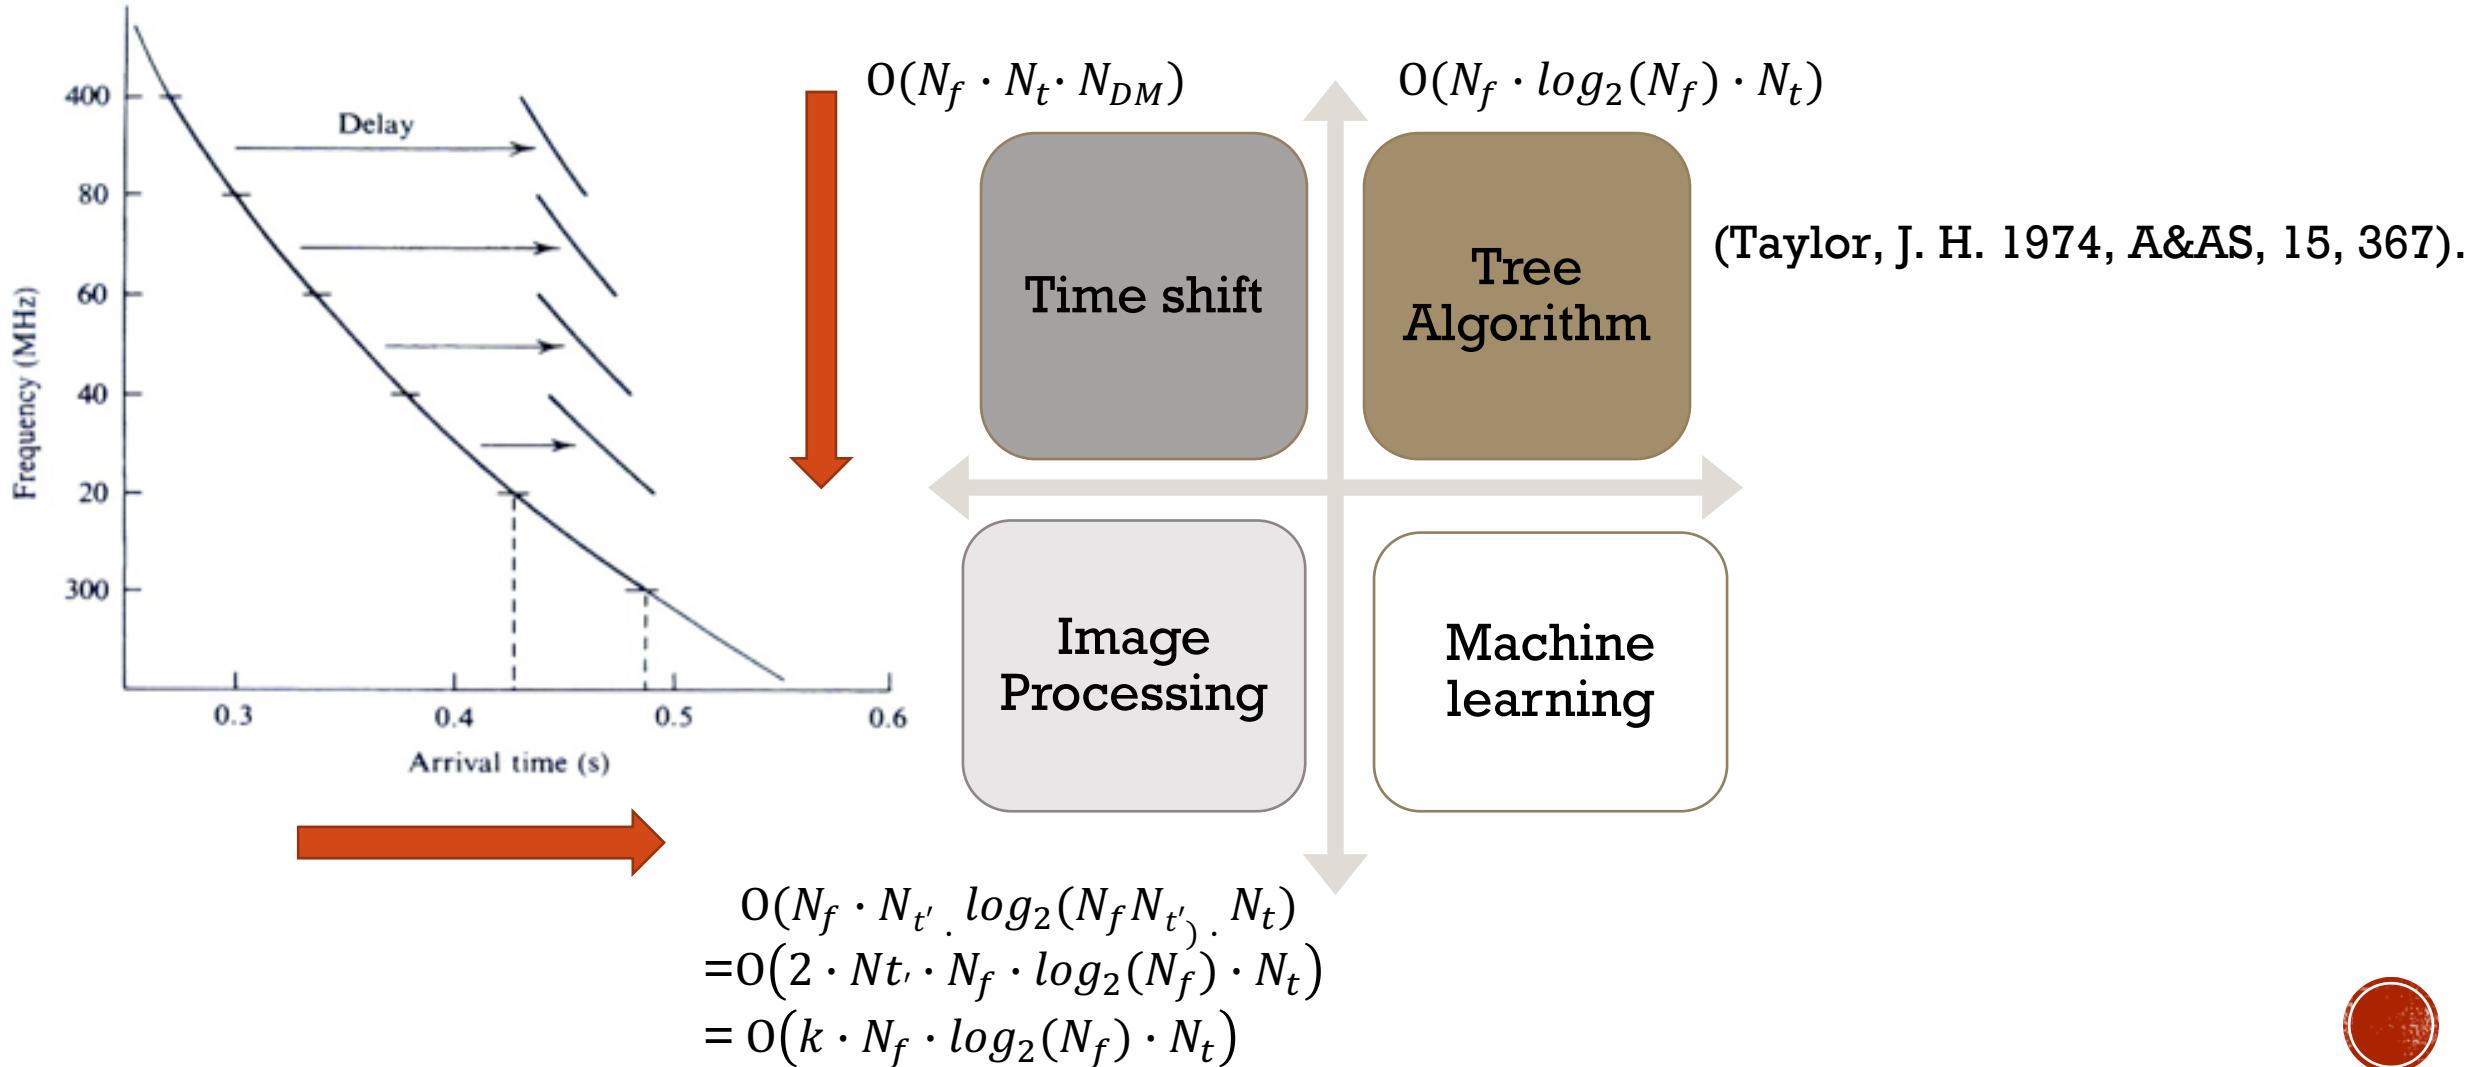

# SCATTER

# SCINTILLATION

# BRIEF REVIEW : PROPERTIES OF 2D FFT

## Sinusoidal Waves

---

In 1D the Fourier transform is based on a decomposition into functions  $e^{j2\pi ux} = \cos 2\pi ux + j \sin 2\pi ux$  which form an orthogonal basis.  
Similarly in 2D

$$e^{j2\pi(ux+vy)} = \cos 2\pi(ux + vy) + j \sin 2\pi(ux + vy)$$

The real and imaginary terms are sinusoids on the  $x, y$  plane. The maxima and minima of  $\cos 2\pi(ux + vy)$  occur when

$$2\pi(ux + vy) = n\pi$$

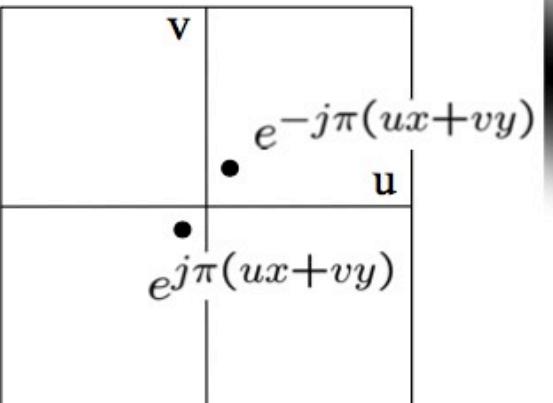

write  $ux + vy$  using vector notation with  $\mathbf{u} = (u, v)^\top, \mathbf{x} = (x, y)^\top$  then

$$2\pi(ux + vy) = 2\pi\mathbf{u} \cdot \mathbf{x} = n\pi$$

are sets of equally spaced parallel lines with normal  $\mathbf{u}$  and wavelength  $1/\sqrt{u^2 + v^2}$ .

To get some sense of what basis elements look like, we plot a basis element --- or rather, its real part --- as a function of  $x, y$  for some fixed  $u, v$ . We get a function that is constant when  $(ux+vy)$  is constant. The magnitude of the vector  $(u, v)$  gives a frequency, and its direction gives an orientation. The function is a sinusoid with this frequency along the direction, and constant perpendicular to the direction.

Here u and v are larger than  
in the previous slide.

	v	
	$e^{-j\pi(ux+vy)}$	
•		u

		•
	$e^{j\pi(ux+vy)}$	

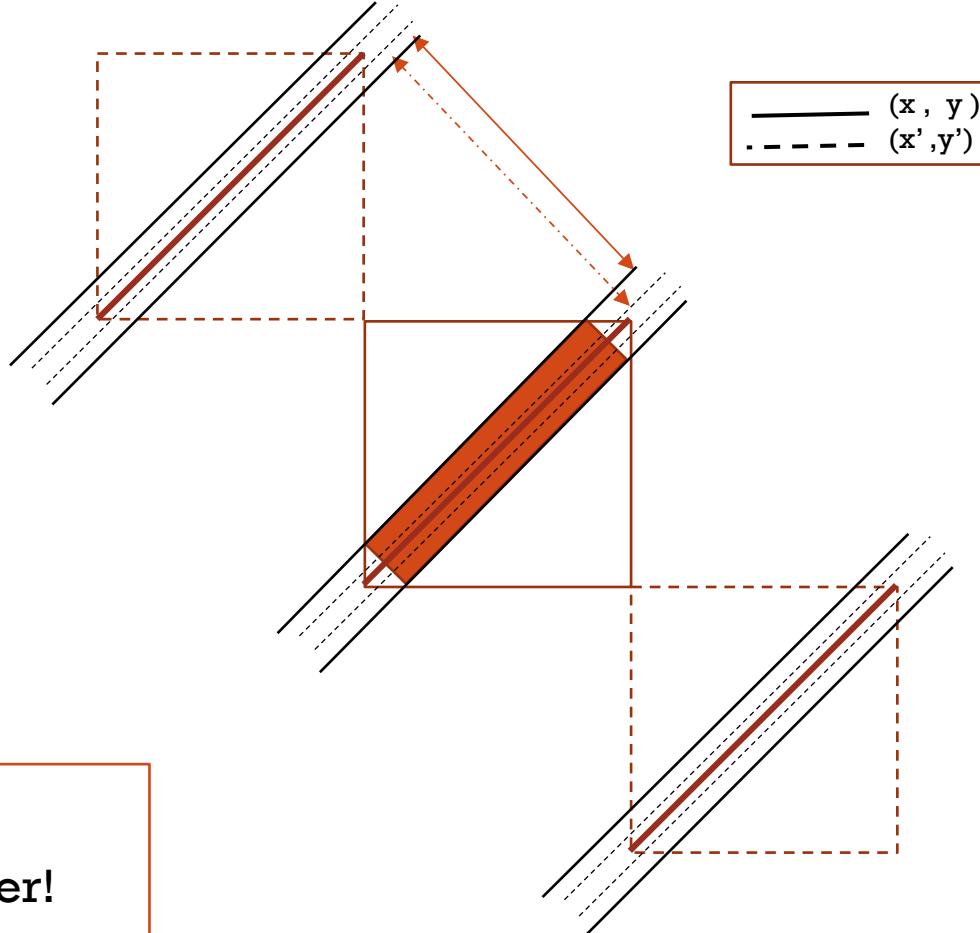

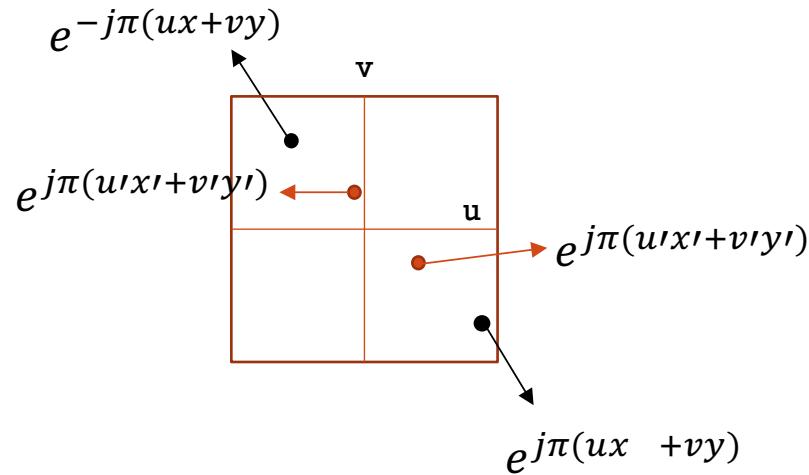

And larger still...

$$e^{-j\pi(ux+vy)}$$

•	v	
		u
		$e^{j\pi(ux+vy)}$

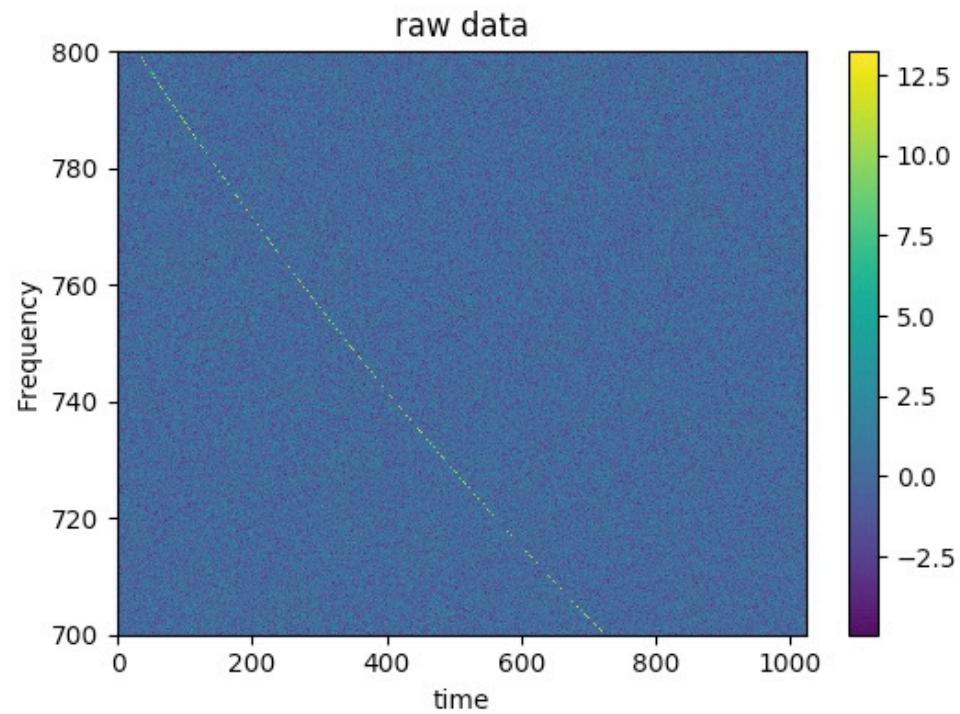

- $\text{Line}(x,y) \perp \text{Line}(u,v)$
- $\text{Line}(u,v)$  is always go cross center!

# USING 2D-FFT SEARCH A LINE !

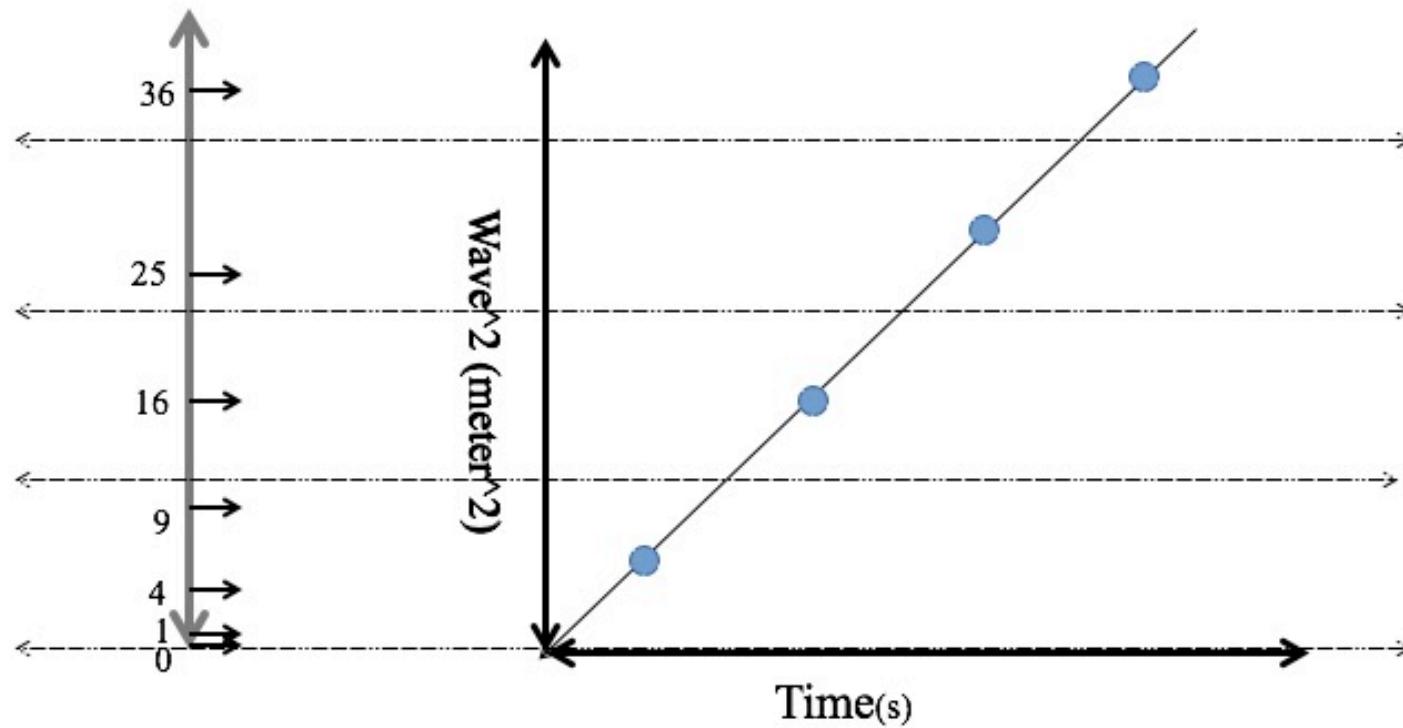

- Rebin
- 2D-FFT
- Polar coordinates transform
- Find signal

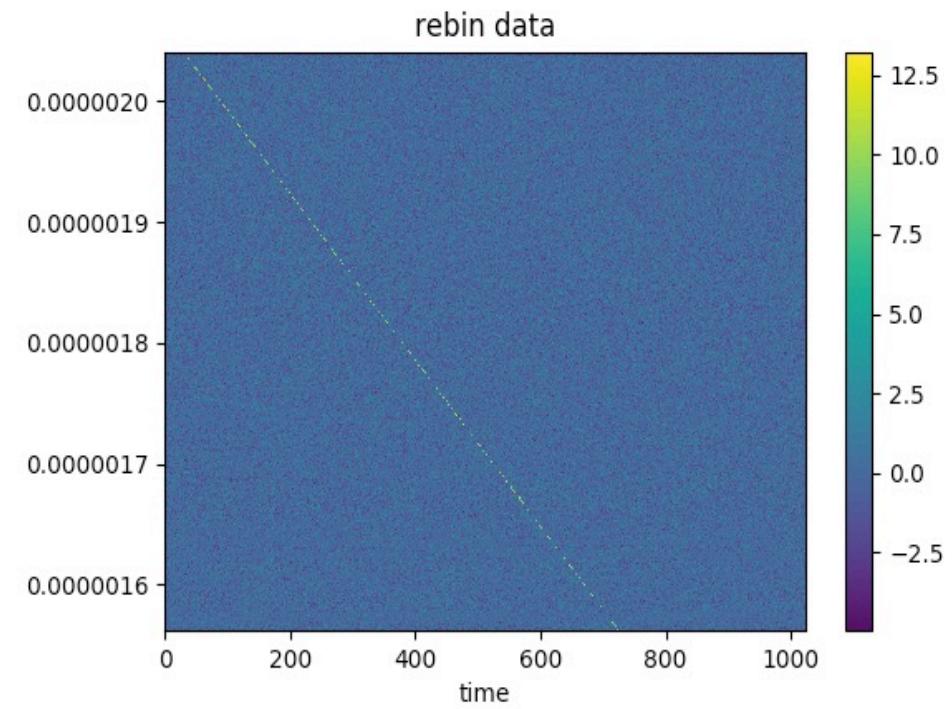

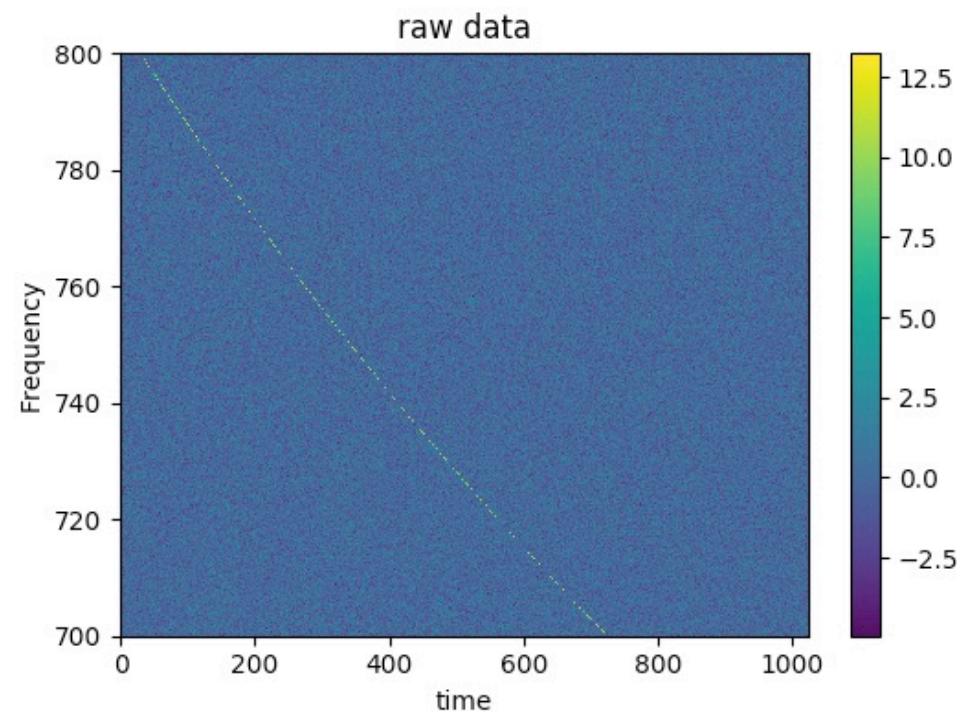

# RE-BIN:

$$\Delta t = 4.15 \times 10^{-6} \text{ ms} \cdot \text{DM} \times (f_{\text{ref}}^{-2} - f_{\text{chan}}^{-2})$$

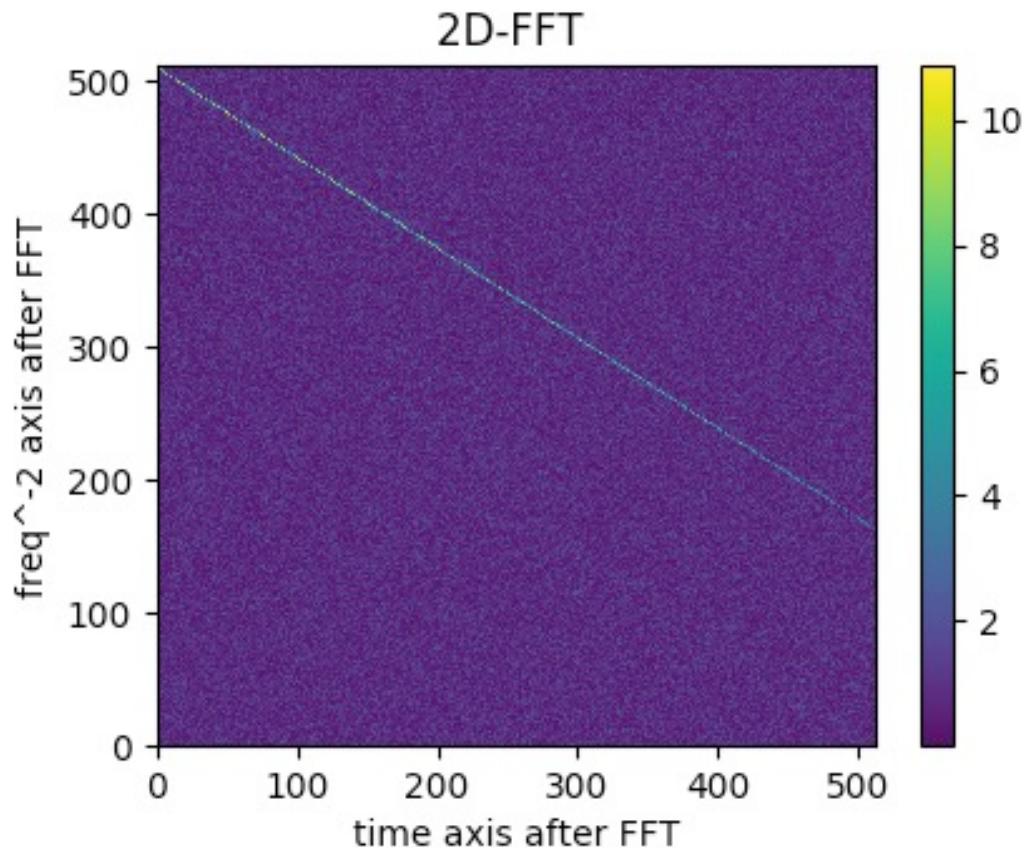

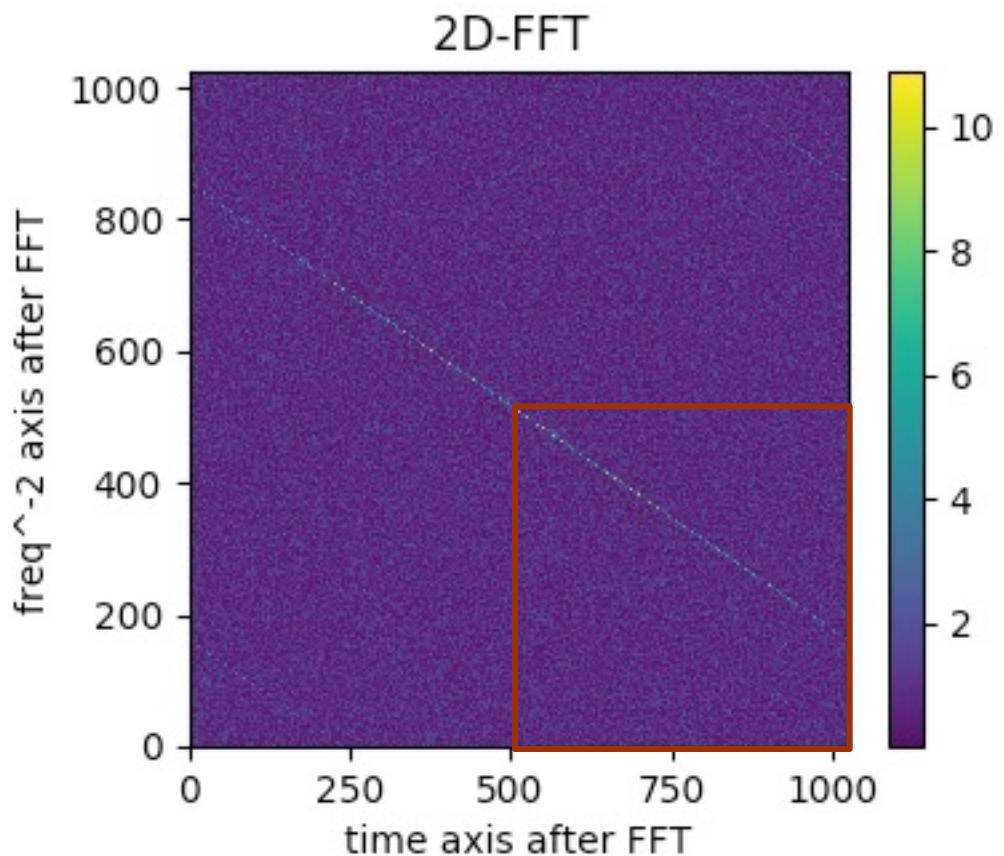

# RE-BIN:

DM = 350

# 2D-FFT:

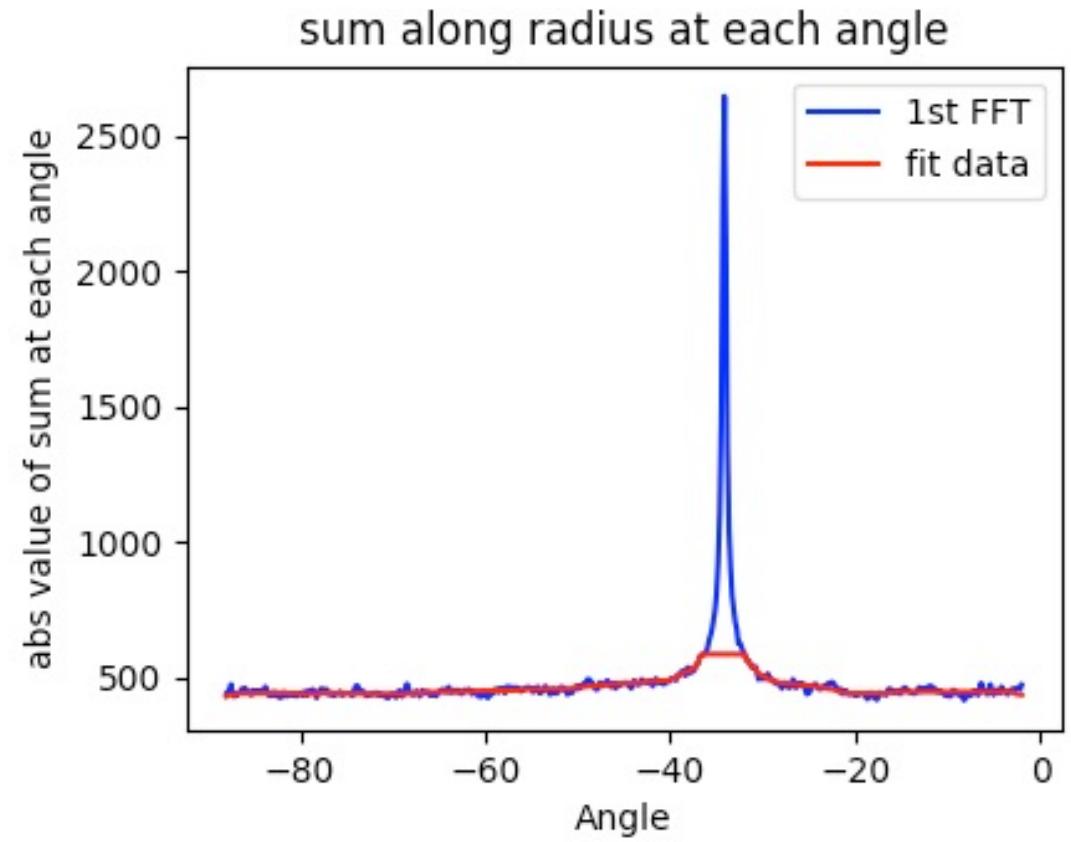

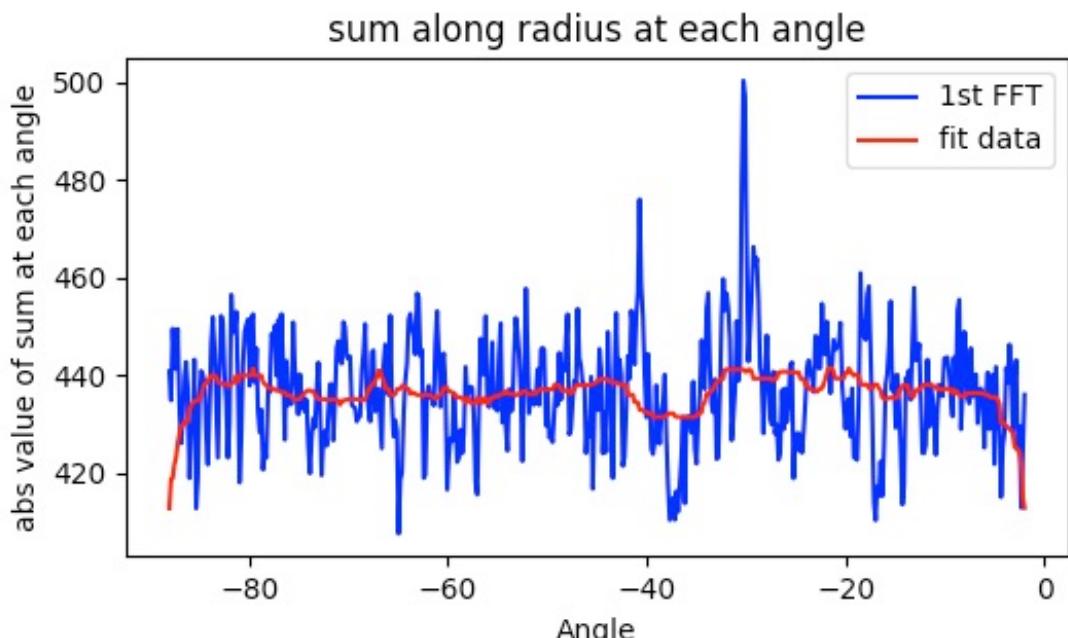

- The straight line in re-bin map will become a straight line go cross center in 2D-FFT map.
- Each angle present a special DM signal line .
- Signal line after FFT should not appear in First and third quadrant. So we only need the 2nd or 4th quadrant data. (it's conjugate to each other.)

# SUM IT UP!

- Sum it up along the radius axis from -90~0 degree.
- Calculate SNR.
- Compare SNR with threshold

Theoretical Input SNR is 320

# DM CALCULATE

$$\Delta t = 4.15 \times 10^{-6} ms \cdot DM \times (f_{ref}^{-2} - f_{chan}^{-2})$$

We usually use  $C = 4.15 \times 10^{-6} ms \cdot MHz^2 \cdot pc^{-1} \cdot cm^3$ . If we assume  $k_1$  stand for the slope of original line, and denote  $k_2$  be the slop of line after 2-D FFT, and  $k_3 = \cot(\theta) = \frac{1}{k_2}$ , We could get:

$$k_1 \cdot unit(k_1) = \frac{f_{chan}^{-2}}{\Delta t} = \frac{1}{C \cdot DM} \quad (2)$$

Here  $k_1, k_2, k_3$  are from geometry, they only stand the digital value of the slop. If we want using it to calculate the DM ,we should add a unit of them when calculate slope. The  $unit(k_1)$ in equation (2) is:

$$unit(k_1) = \frac{\max(f^{-2}) - \min(f^{-2})}{N_{bins}} \cdot \frac{1}{t_{samp}} \quad (3)$$

As two lines perpendicular to each other, the two slopes  $k_1$ ,  $k_2$  are also obeyed one rule:

$$k_1 = \frac{-1 \cdot N_{bins}}{k_2 \cdot N_{tsamp}} \quad (4)$$

From (2)(3)(4), we could get relationship between DM and  $k_2$ :

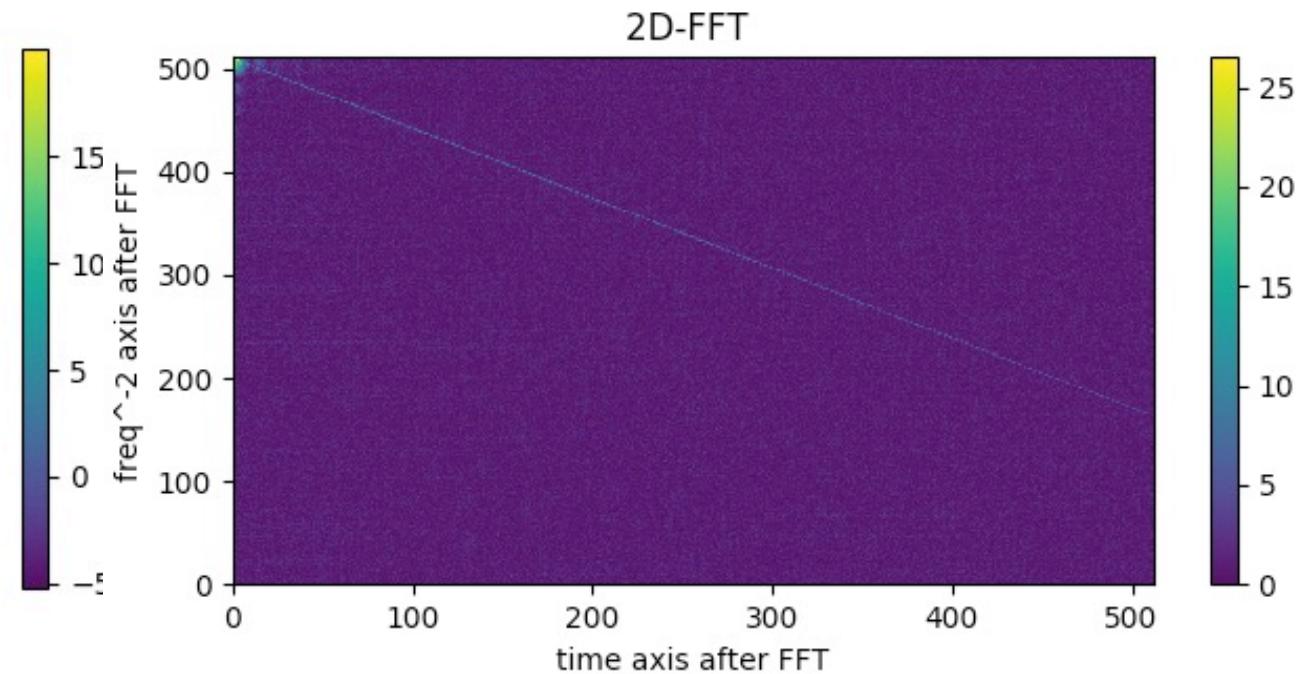

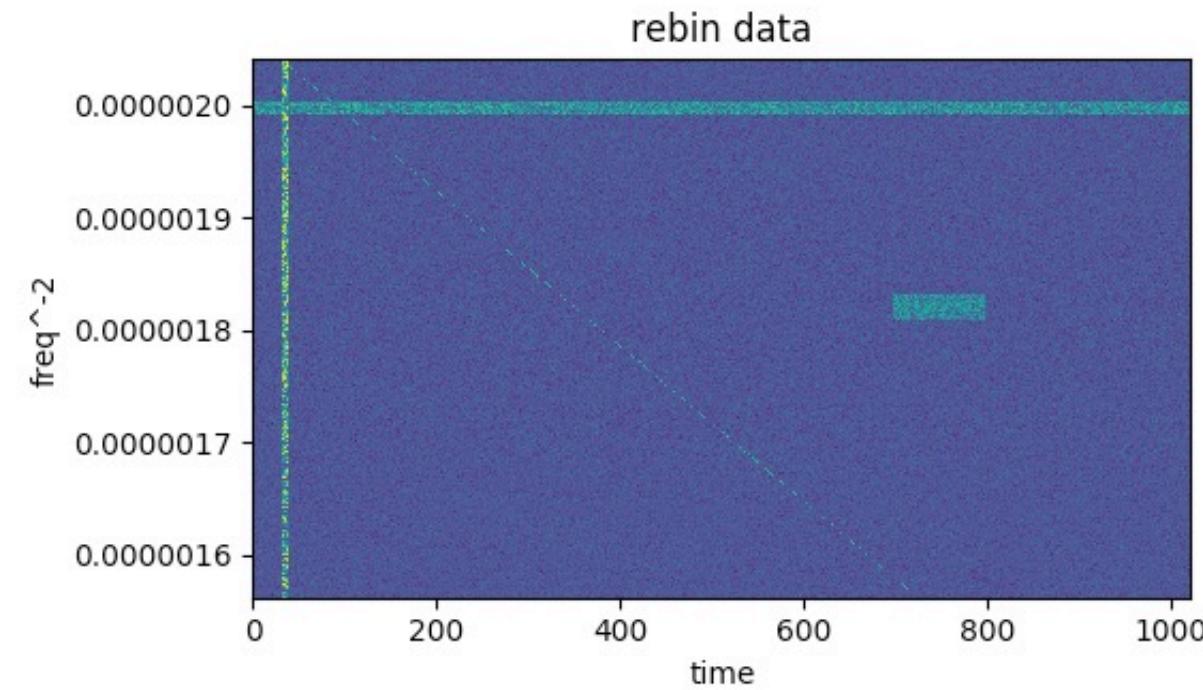

$$DM = \frac{-1}{C} \cdot \frac{N_{tsamp} \cdot t_{samp}}{\max(f^{-2}) - \min(f^{-2})} \cdot k_2 \quad (8)$$

# ADVANTAGE OF THIS METHOD:

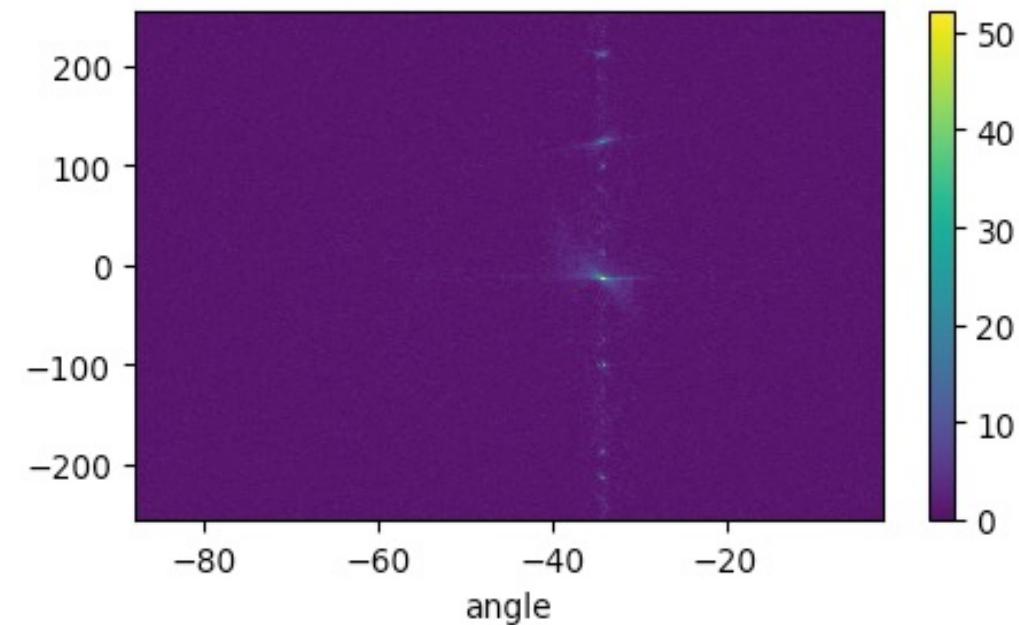

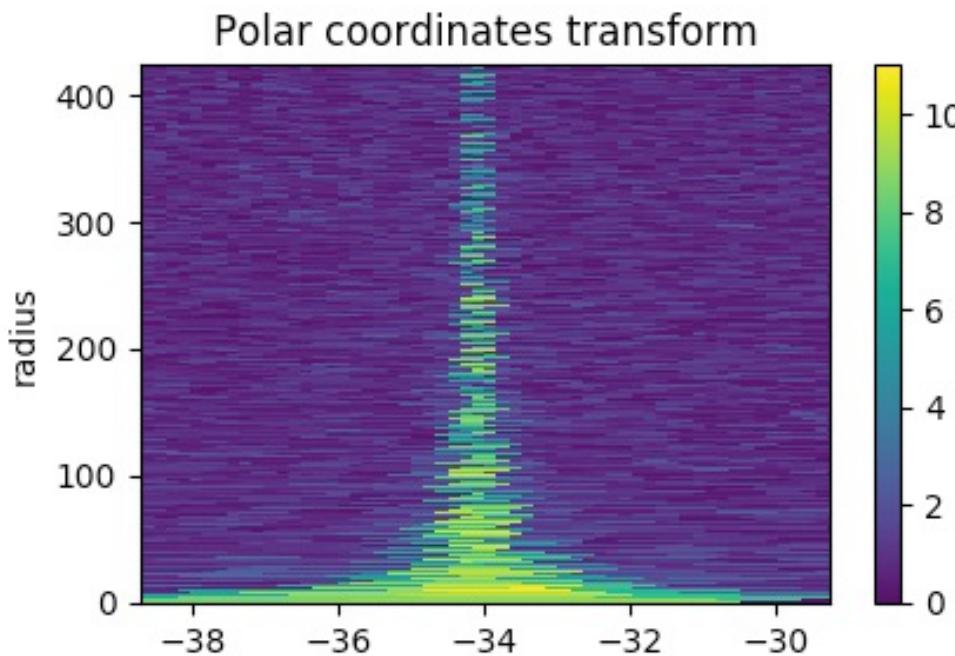

- Compute complexity, this method is equal to tree algorithm
- Easy to remove RFI
- Easy to Parallelize (GPU)

$$\begin{aligned} & O(N_f \cdot N_{t'} \cdot \log_2(N_f N_{t'}) \cdot N_t) \\ & = O(2 \cdot N_{t'} \cdot N_f \cdot \log_2(N_f) \cdot N_t) \\ & = O(k \cdot N_f \cdot \log_2(N_f) \cdot N_t) \end{aligned}$$

# PROSPECT IN FUTURE:

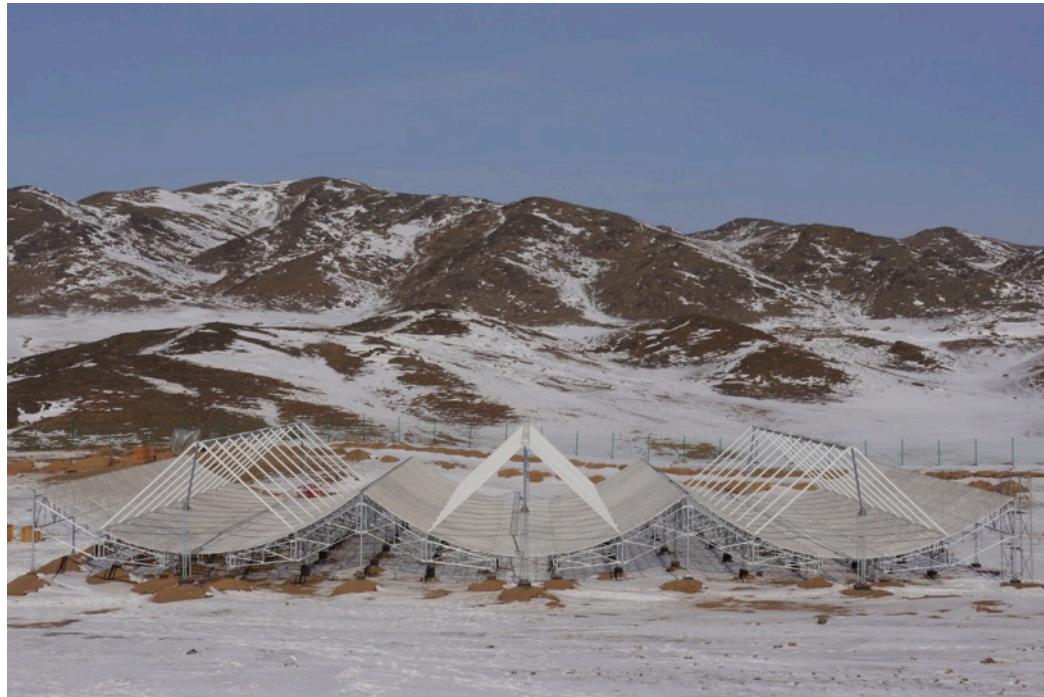

- Try second 1-D FFT to improve SNR
- Try 2-D FFT first then do Radon transform to search a line.
- Or try Radon transform directly to search a line or curve in frequency-time map.

# ADVERTISEMENT TIME!

# TIAN LAI ARRAY!

In Xinjiang, North western China. We build 3 telescope cylinder + 16 dishes interferometer .

$96 \times 2 = 192$  inputs

$16 \times 2 = 32$  inputs

# TELESCOPE PARAMETER FOR FRB

Band Width : 100MHz

Frequency: 700-800MHz

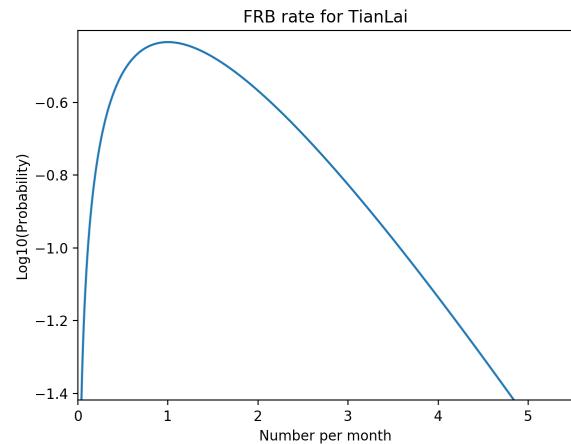

Cylinder Scale: L 40m , Diameter 15m

Dish Scale: Diameter 6 m

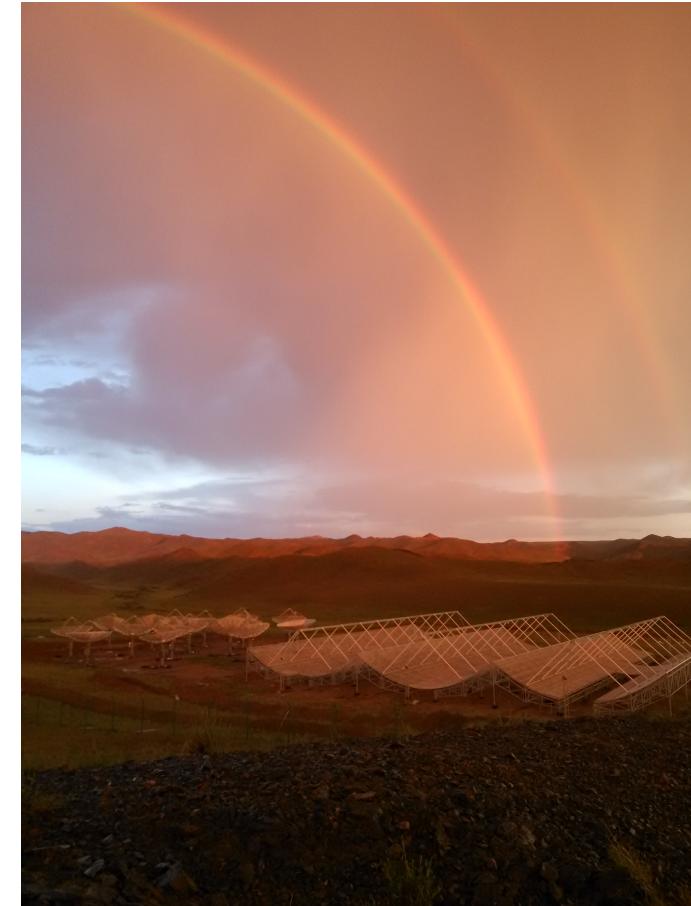

FOV: 160 Deg<sup>2</sup>

Time Resolution: 50ms

Beam number: 32< N <96

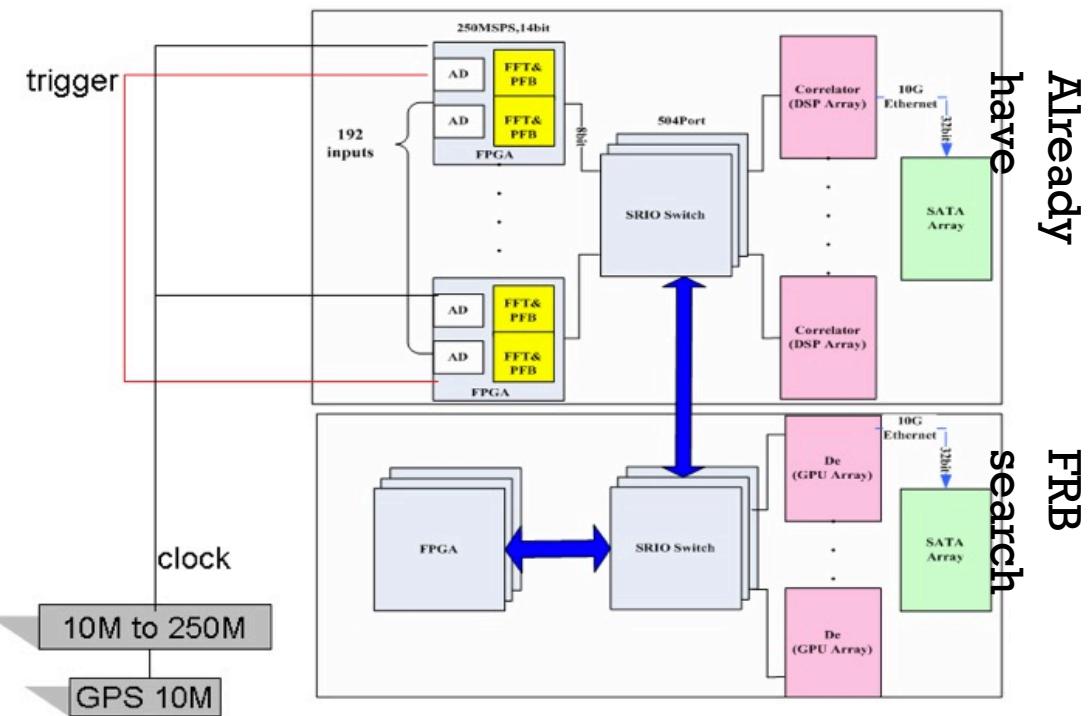

Above 95% confident  
interval, We could see  
0.05~4.5 FRB Per Month!

# DIGITAL BACKEND(PLAN)

- Using SRIO to make a data copy.
- Beamforming by FPGA(GD2FPGA designed by IACAS).
- De-dispersion are processed by GPU Array.
- High speed SRIO switch.
- GPU server SRIO NIC
